INTRODUCTION

The Movie Ticket Booking System is a web-based application developed using React.js, HTML, CSS, and JavaScript. It is designed to automate the process of booking movie tickets online, reducing the need for manual ticketing and providing a seamless user experience. The system allows users to browse available movies, select seats, and make bookings through a responsive and interactive user interface

1. Introduction :

Welcome to the documentation for our Online Movie Ticket Booking System. This system is designed to facilitate the booking of movie tickets through an online platform, providing users with convenience and flexibility in selecting seats, showtimes, and movies. This document serves as a comprehensive guide for users, administrators, developers, and testers to understand the functionalities, architecture, and usage of the system.

2. System Overview :

Our Online Movie Ticket Booking System enables users to browse movies, view showtimes, select seats, and make bookings from the comfort of their homes or on the go. The system caters to both registered users and guests, offering a seamless booking experience. Administrators have access to backend functionalities for managing movies, showtimes, and user bookings.

3. System Architecture :

The system follows a client-server architecture:

- Frontend: Developed using HTML, CSS, and JavaScript frameworks such as React.js.

The frontend provides an intuitive user interface for browsing movies, selecting seats, and making bookings.

- Backend: Built using Node.js and Express.js, the backend serves as the middleware between the frontend and the database. It handles authentication, business logic, and database interactions.

- Database: Utilizes a relational database management system (e.g., MySQL, PostgreSQL) to store data such as user profiles, movie details, showtimes, bookings, and seat availability.

4. Functional Requirements :

- User Registration: Users can create accounts by providing necessary details such as email, password, and personal information.
- User Authentication: Registered users can securely log in to their accounts using email and password authentication.
- Browsing Movies: Users can browse through a list of available movies, sorted by genres, release dates, or popularity.
- View Movie Details: Users can view detailed information about each movie, including synopsis, cast, duration, ratings, and reviews.
- Search Movies: Users can search for specific movies using keywords or filters.

- View Showtimes: Users can see the available showtimes for selected movies and theaters.
- Select Seats: Users can select seats for a particular showtime from an interactive seating layout.
- Book Tickets: Users can book tickets by specifying the number of seats and providing payment information.

5. Non-functional Requirements

- Performance: The system should be able to handle concurrent user requests efficiently, ensuring a smooth booking experience even during peak hours.
- Reliability: The system should be robust and reliable, with error handling mechanisms in place to gracefully handle unexpected errors or disruptions.

Data integrity should be maintained to ensure the accuracy of booking

Information.

Limitation Of Existing System

Traditional systems require manual booking at cinema halls.

- Lack of real-time seat availability tracking.
- No centralized database to manage user bookings.
- Difficulty in managing shows, seats, and cancellations.
- No personalized user experience or booking history tracking.

It is virtually impossible for a human being to be accurate and perfect all the time. This is where errors occur.

Common limitations of system resources include limited processing power, insufficient memory, inadequate storage, and restricted network bandwidth.

Processing power is a fundamental limitation of system resources. The speed and efficiency of a computer system are largely determined by its Central Processing Unit (CPU).

Objectives

To develop a responsive web-based movie ticket booking platform.

- * To allow users to view available movies and select show timings.
- * To implement real-time seat selection and booking.
- * To maintain booking records in a structured database.
- * To enhance the overall user experience using modern frontend technology.

Scopes

The system will be accessible on desktops, tablets, and mobile devices.

Admins can add/update/delete movies, showtimes, and seating arrangements.

Users can book, view, and cancel tickets.

Payment gateway integration can be added in future versions.

Could be scaled to support multiple theaters.

Advantages

- Quick and convenient booking process.
- Real-time seat availability.
- Reduced human error and workload.
- Centralized booking and management system.
- Scalable and maintainable using modular React components.

System Design

Although React.js is frontend, a backend with a database (e.g., Firebase, MongoDB, or MySQL) would be assumed for complete implementation.

A typical database design

DataBase Design :

Screenshots

Registration page :

The screenshot shows a web browser window with the URL `localhost:5173/Register`. The page has a dark theme. At the top left is the logo "M4You" in orange. To its right are navigation links: "Home", "Movies", and "Contact". On the far right of the top bar are icons for a map, a share button, and a user profile. The main content area is titled "Register for Movie Ticket Booking" in orange. Below this title are five input fields, each with a label above it: "Full Name", "Email Address", "Phone Number", "Password", and "Confirm Password". All input fields are currently empty. Below the input fields is a large orange button labeled "Register". At the bottom of the form, there is a link that says "Already have an account? [Login here.](#)".

Login Page :

1. Home Page :

Front page of website --

After scroll shows the movies in home page–h

2. Movies Page :

Showing the all movies --

3. Seat Booking Page :

After click seat booking in movies then render the booking page –

4. Contact US Page :

Coding :

This is a basic structure of the component and snippets from the React.js application

App.jsx :

```
import { useState } from 'react'
import Navbar from './component/navbar'
import Movies from './component/Movies'
import Home from './component/Home'
import { BrowserRouter as Router, Routes, Route } from
'react-router-dom'
import Footer from './component/Footer'
```
